

## LOADING INSTRUCTIONS FOR MAC USERS

### Photoshop Actions

Place your .atn file in your photoshop actions folder.

Your .atn file is a set of five color actions. After your .atn file is copied to a folder, load the action set in photoshop. In your action's menu, use the small arrow at the top right side of the palette. Using the pull down menu—select “load actions”. Select your .atn file from the folder, then click “load”. Your action set is now loaded.

### Presets

- Place your .xmp (acr) files here:

your home\library\application support\adobe\camera raw\settings

After your .atn file is copied to the camera raw setting's folder, load the presets in camera raw. At the top right side of your camera raw window, under the histogram, you will see a “settings” pull down menu. Using the small arrow to the left, then select “load settings”. Select each .xmp file individually and click “load”. You must repeat this step for each preset. Your ACR presets are now loaded. To select the preset during workflow, use the setting's pull-down menu to select which preset you would like to view. Then use your mouse to scroll thru each setting as you decide which setting works best for your photograph.

- Place your .lrtemplate (lightroom) files here:

your home\library\application support\adobe\lightroom\develop settings

After you place your .lrtemplate files in the folder, open lightroom and you will see your presets under the preset palate.
